AR in the City

A collaborative team, consisting of AR expertise at Mimas and a number of key people across the sector came together to create an AR Sociology experience - AR in the City.

Come with us on a tour and understand more about different areas of the city including the social aspects of 3 different topics: Housing, Crime and Family. Discover some surprising facts about the city and compare and contrast data. This is aimed at sociology students, but could be used more widely. Alongside the AR experience; a teaching support pack is available, which includes key teaching & learning activities. The app has been created with sociology students in mind, but could be used more widely for both A level students and first year undergraduates.

As a Sociology or Criminology educator (or just a teacher with an interest) you have the chance to be amongst the first to engage with a new teaching tool, which will examine social inclusion and exclusion like never before. Mobile phones and other internet enabled devices are driving the development of augmented reality and we want our educational communities to be involved in the direction it takes for teaching.

Take a tour yourself - download the Junaio App and scan the image on the front, or via the QR code opposite.
